# Experience the Lab Environment

The Docker image used for this course is used for many of our Java courses, and so this lab is in each such course before the first content-related lab.

1. Open The Lab

2. Set The Display Resolution

   - Click on Applications (Top Left of Screen)
   - Click on Settings (6th Item Down)
   - Click on Display (5th Item Down)

3. In the resulting dialog, choose from the list of available resolutions on the right hand side the resolution that most closely approximates your own host's resolution that would allow you to see the full screen to be displayed without scrolling, if feasible. In our examples, we are using 1360x768.

- Click on the desired resolution

- Click Apply
- Click Close

Please note that this may need to be done any time when opening a Lab environment. You may also choose to use different resolutions depending upon your current hardware, system settings and networking speeds. Higher resolutions are often desirable when using the Eclipse editor to do Java programming, so keep that in mind as well.

To complete this lab, simply click on the Cancel button instead of opening Eclipse.
